

MANNY STUD SET TIP SHEET

PLEASE READ BEFORE INSTALLATION!

Thank you for your purchase of the highest quality manifold fasteners you can get on the planet. Just as with any new product put to use out in the field, a few things have been discovered along the way that we can pass along to you.

First, before installing these studs into the head, it would be advisable to chase the threads in the head. If installing the 8mm stud set, use an 8mmx1.25 chaser (or 10mmx1.25 chaser if installing the 10mm stud set) along with "Tap Magic" or equivalent thread cutting lube. This will make sure the stud will go in easy without seizing, damaging the broached end of the stud or worse yet, busting the allen wrench that is used to install them.

When installing your manifold, torque the 12 point nuts to 20 ft./pnds..

Secondly, periodically double check the torque on the nuts. Because the nuts are not self-locking, it has been found that they can spin off of there and drop to never-neverland. Say bye bye.....not a good deal.

Again, thank you for your purchase of this fastener kit. I'm sure you will find it to be superior over anything you have ever used!

Warranty Disclaimer: Due to the intended use, there is NO warranty stated or implied to Racing Components, as we have no control over their installation or use.
